MEGADYNE™ disposable return electrode removal information

Megadyne’s single-use patient return electrodes have a high level of adhesion to prevent detachment. Because of this robust adhesion, care should be used when removing the pad to prevent skin denuding or tears.

During removal, the return electrode should be grasped by one corner and carefully detached with one hand, using the other hand to support and provide gentle counter-traction as shown in image 1 and image 2.

The pad should be removed from one narrow side to the other narrow side. The electrode should not be removed by grasping the cable.

Following removal, a skin assessment should be performed.
